

RODERICK ROCAMORA

Senior Full-Stack Engineer · AI-Native Development · SaaS & Distributed Systems

Cagayan de Oro (CDO), Philippines (*open to client timezone alignment*) | ric2xroc@gmail.com | (+63) 977 830 9787

GitHub: <https://github.com/rodroc/cv> | LinkedIn: <https://www.linkedin.com/in/roderickrocamora/>

PROFESSIONAL SUMMARY

AI-native senior full-stack engineer with deep production experience in Node.js, TypeScript, and PHP, with full-stack delivery across React.js and Next.js, specializing in multi-tenant SaaS architecture, AI-integrated backend systems, and distributed event-driven platforms. Delivered production systems from the ground up — multi-tenant data isolation, enterprise RBAC, event-driven messaging pipelines, React-based frontends and mobile backend APIs, and AI-powered recommendation engines — with AI-assisted development tools embedded in the daily workflow. Consistent track record of end-to-end platform ownership across backend services, API design, cloud deployment, and cross-functional collaboration in fully remote environments.

TECHNICAL SKILLS

Certifications: Ultimate Design Patterns · Clean Code · React 18

CAREER HISTORY

Jun 2025 – Present · Contract Software Engineer (Remote)

Full-Stack · AI Integration · SaaS · DevOps

AI-Powered Fleet Repair Platform (*Completed Engagement — U.S. Client*)

servicebay.ai

- Led backend engineering for a production voice-first, AI-driven fleet repair SaaS — owned system design, TypeScript API delivery, and code quality standards across a cross-functional distributed remote team
- Architected the production multi-tenant SaaS core — per-tenant data isolation, subdomain-based client routing, and tenant-scoped access control enforced across all microservices and service layers
- Implemented production enterprise identity and access management via IAM provider (FusionAuth) — JWT authentication and RBAC across dispatcher, technician, and customer roles
- Built and deployed AI-powered parts recommendation engine — voice AI pipeline consuming speech-to-text transcription events to surface real-time inventory suggestions and optimize repair dispatch workflows
- Designed and deployed pub/sub messaging backbone (NATS JetStream) for distributed real-time event propagation — keeping full-text search indexes (Typesense), mobile clients, and notification services in sync across all tenant activity
- Engineered production RESTful API design for the technician mobile app — GPS location tracking, tenant-isolated object storage (S3/MinIO), job assignment workflows, and offline-capable data sync
- Delivered production end-to-end service order lifecycle API: intake → technician assignment → diagnosis → parts procurement → customer authorization → repair completion → invoicing
- Enforced engineering quality via CI/CD pipelines — TypeScript strict-mode checks, automated security vulnerability scanning, and ESLint; standardized Docker-based cloud deployment on Railway

Stack: Node.js · TypeScript · PostgreSQL · NATS JetStream · Redis · Typesense · FusionAuth · S3/MinIO · Docker · Railway · Twilio · Tailwind CSS

Project Management SaaS Platform (*Completed Engagement — U.S. Client*)

github.com/rodroc/react-supabase-project-management

- Sole full-stack engineer on a production SaaS project management platform — architected the backend from scratch and delivered end-to-end from Figma UI/UX designs to live production software using TypeScript across React and PostgreSQL

- Engineered production security architecture — multi-tenant row-level security (RLS) at the database layer with RBAC enforced via triggers and UI-layer permission gates; zero cross-tenant data leakage, approval chain configuration, and referential integrity on deletion
- Built 5 custom React hooks replacing all static/mock data with live Supabase CRUD, optimistic updates, and rollback — fully integrated across Projects, Work Orders, Tasks, Roles, and People modules
- Built drag-and-drop work order scheduling across Day/Week/Month calendar views — backed by optimized PostgreSQL date-range query functions and a materialized view
- Delivered Earned Value Management (EVM) Budget module — real-time cost tracking, schedule variance analysis, and budget forecasting with performance-optimized React rendering
- Achieved 100% test pass rate across 731 automated tests — unit, integration, and E2E (Playwright) suites covering frontend and backend
- Managed full deployment lifecycle — CI/CD on Vercel for development, production migrated to Azure for enterprise-grade cloud hosting

Stack: React · TypeScript · PostgreSQL · Supabase · Vercel · Azure · Vitest · Playwright

AI-Powered Financial Operations SaaS Platform (Ongoing Engagement — U.S. Client, Under NDA)

- Contributed production generative AI infrastructure and security architecture for a U.S. financial SaaS platform serving professional practices and their advisors
- Authored the full technical spec for the AI CFO Narrative feature — prioritized LLM integration task breakdown, tooling architecture, and access control alignment; planning directly shaped the production implementation
- Built the complete generative AI infrastructure layer — Anthropic SDK integration, streaming LLM responses, financial data context builder, response caching, rate limiting, RBAC-gated per-tier access controls, and database storage for AI-generated financial insights per practice
- Implemented AES-256 data security for third-party credentials — QuickBooks, Google Ads, and Facebook Ads API keys encrypted at rest, protecting against credential exposure in a breach
- Built tamper-evident audit logging for all auth and integration lifecycle events; added silent OAuth token refresh across connected integrations to eliminate session interruptions

Stack: Node.js · TypeScript · PostgreSQL · Anthropic Claude API · QuickBooks API · Google Ads API · Facebook Ads API · Stripe · AES-256

Jul 2020 – Apr 2025 · Software Engineer — Concierge Plus, Property Management SaaS (Canada, 4 yrs 9 mo)

TypeScript · Node.js · AWS (Lambda, API Gateway, S3, ECS, Fargate, SQS, EventBridge, CloudWatch) · PHP · MySQL · Docker

- Built a Node.js/TypeScript data integration system syncing resident records at scale across 75K+ building units within a multi-tenant property management SaaS environment
- Operated production AWS serverless and container infrastructure — Lambda, API Gateway, ECS on Fargate, SQS, EventBridge, S3, and CloudWatch across decoupled event pipelines and multi-tenant document storage
- Integrated PlacePay API for recurring, bulk, and manual payment processing; implemented time-block amenity booking, ledger transactions, and recurring payment settings across multi-tenant accounts

Dec 2015 – Feb 2020 · Software Engineer — TruEnergy Services, Logistics & CRM (Dallas TX, USA, 4 yrs 3 mo)

Node.js · PHP · Golang · Twilio · Solr · MySQL

- Built browser-based call and SMS communication for truck drivers across multiple trucking companies via Twilio, Node.js, and Socket.IO
- Integrated vTiger CRM for invoicing and settlement management; built Excel parsing pipelines for supplier data extraction and ESI/Meter ID contract validation
- Developed a Golang file service with JWT authentication for secure CRM-to-web-app integration

- Optimized voice recording search using Solr, reducing query response time from minutes to seconds across a large driver dataset

Sep 2013 – Dec 2015 · Software Engineer — Multi-client Outsourced Projects (2 yrs 4 mo)

ASP.NET · PHP · Symfony · MySQL · MSSQL

- Delivered XBRL financial web apps, invoice account split tools, contractor registration platforms, and membership management systems across multiple clients using ASP.NET MVC, Symfony2, Entity Framework, and Doctrine2

EARLIER EXPERIENCE

Software Engineer / Systems Architect · C#, ASP.NET, PHP — savings and loan management, SMS top-up gateway, billing, AR/AP, inventory, and HR information systems across financial and enterprise clients

EDUCATION & PERSONAL

Computer Engineering — Liceo de Cagayan University, Philippines **Languages:** English (*professional*), Tagalog, Cebuano **References:** Available upon request
